

BIOFILM2 – Michelle Kuttel

Byron Clarke, Ruth Rudolph, Sonali Naidoo

Choice of prototype:

Choice: Horizontal Evolutionary Prototype

Our team chose to adopt an evolutionary prototyping approach because it enables effective feedback from the client and enables us to re-assess throughout the development process. By demonstrating a basic working prototype at this stage, the client can assess the progress made and verify whether the system is developing in line with their requirements. This iterative refinement helps ensure that the final product aligns closely with user expectations.

We selected a horizontal prototype to provide a broad overview of the system's major components. This approach allows the client to evaluate the overall structure and features of the simulation without focusing on full functionality and aesthetic at an early stage. By exposing a wide range of features, at a basic level of functionality we encourage more comprehensive feedback on each element of the design.

Accordingly, each class has been outlined to some extent, either through placeholder methods and variables that indicate the intended functionality or through basic implementations of key features. This provides enough structure for meaningful evaluation while leaving room for valuable criticism.
